KellyDown Tips

Periodic tips to help you use KellyDown more effectively

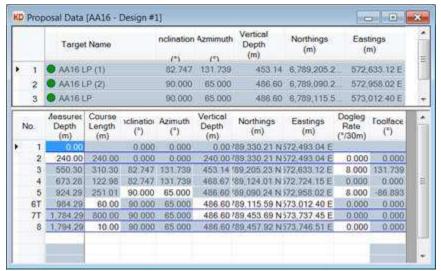

Running KellyDown on Windows 10 computers

Here is a list of problems that some people have experienced when running KellyDown on the Windows 10 operating system. All issues have something to do with the screen display settings and are very easy to resolve.

Problem: A few people have commented on the fact that text on many of the forms in KellyDown does not fit inside the dialog when running under Windows 10. In some cases the **OK** and **Cancel** buttons are either half hidden or not visible at all on the form. In spreadsheet modules, the column headers do not fit within the width of the column and some numbers are clipped.

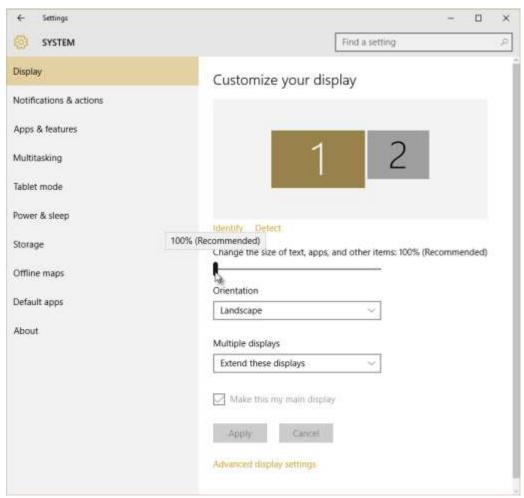

Cause: KellyDown is designed to Microsoft Windows specifications and rather than hard-code colours or allow custom configurations for the user interface, it relies on the **Windows Display Settings**. One

consequence of this however is that it is also affected by the Windows font size, which may be changed by the user if he or she has selected a theme in which the fonts are larger than the default size or in some instances, the font size is changed by the Windows operating system itself.

Solution: Under Windows 10, it is very simple to change the font size; simply right click on the Windows Desktop and select **Display Settings**.

Then change the **Font Size** to 100% (Recommended) by sliding the cursor all the way to the left.

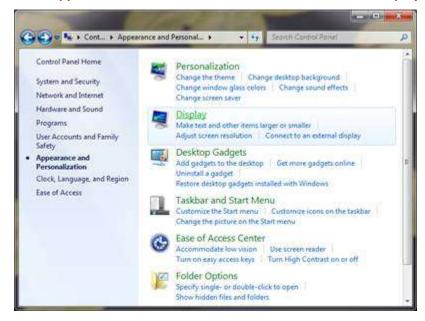

Under earlier versions of Windows, select the **Windows Control Panel** by clicking on the Windows **Start** button and selecting **Control Panel**.

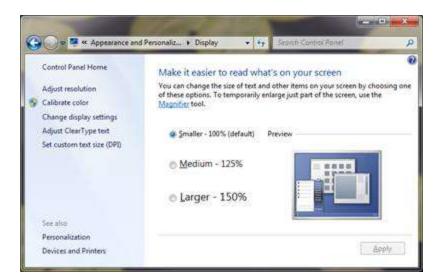

In the **Control Panel**, click on the **Appearance and Personalization** link.

In the Appearance and Personalization window, click on the Display link.

Set the **Text Size** to **Smaller - 100% (default)** and click on the **Apply** button. You may have to log out of and back into Windows to affect the changes.

The KellyDown **User Login** screen should then look like this...
