

KellyDown Tips

Periodic tips to help you use KellyDown more effectively

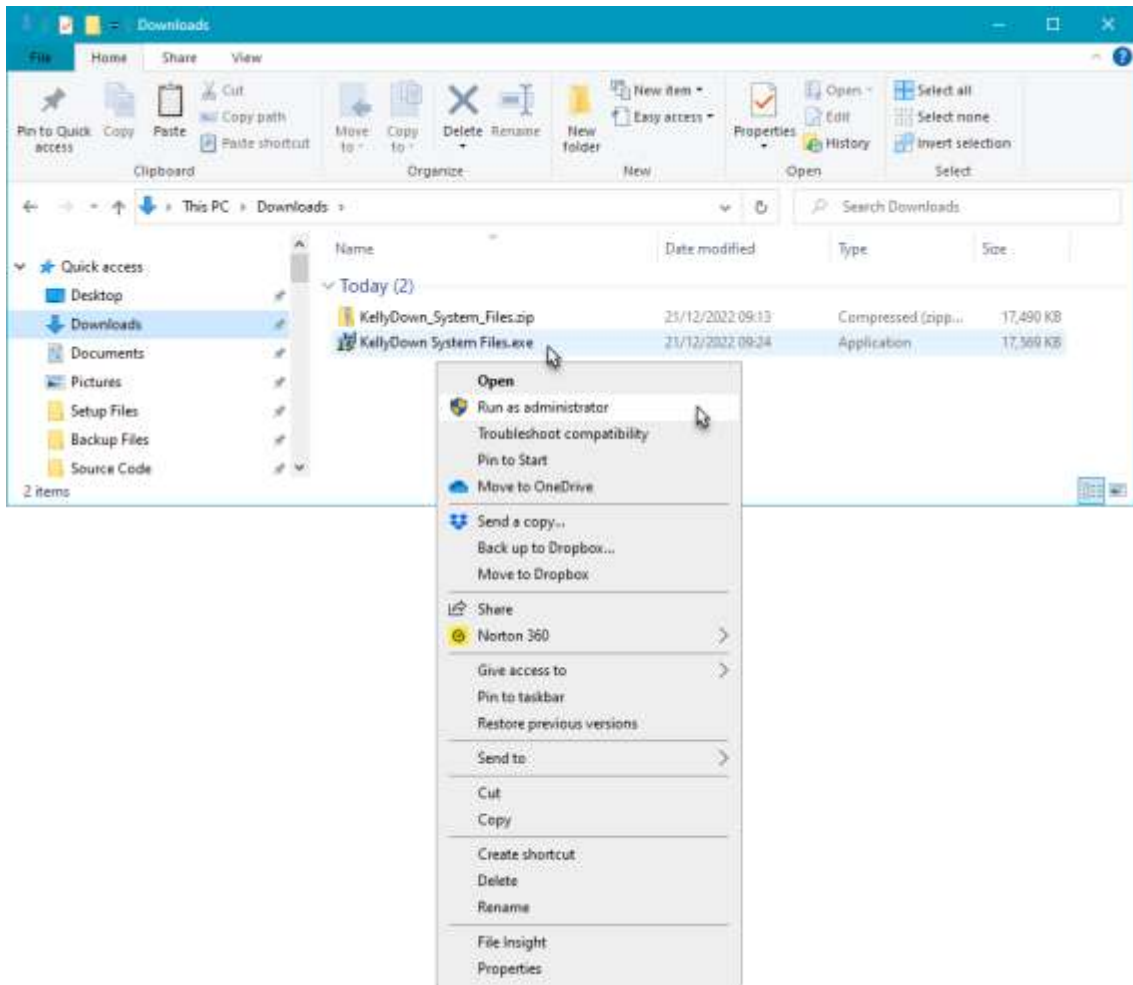

Updating the KellyDown System Files

Windows security sometimes prevents the KellyDown system files from being updated. Windows security requires that a program be **Run as Administrator** in order to update system files but because KellyDown downloads and installs a patch when run from the **Help, Check for updates** menu, the setup cannot be **Run as Administrator** and consequently, the system files aren't always updated.

If expected new coordinate systems or some other new functionality is not observed after a patch has been installed, it is likely because the system files need to be installed by an Administrator. Please follow these procedures in order to update the KellyDown system files separately.

1. Click [here](#) to download the **KellyDown_System_Files.zip** file.
2. Unzip the **KellyDown_System_Files.exe** file from the zip file.
3. Right click on the **KellyDown_System_Files.exe** file and select **Run as Administrator**.

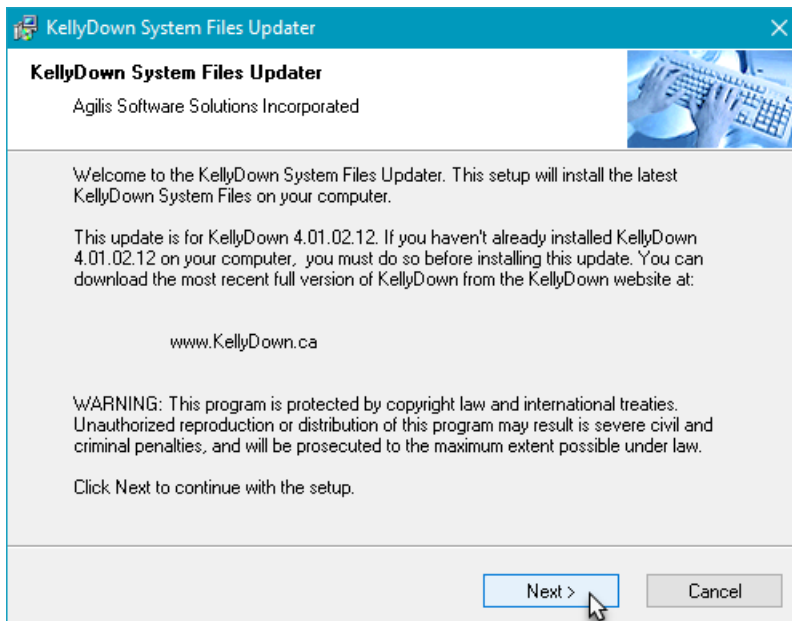

4. Microsoft Defender may warn you not to trust the executable file. Click on the **More** link.

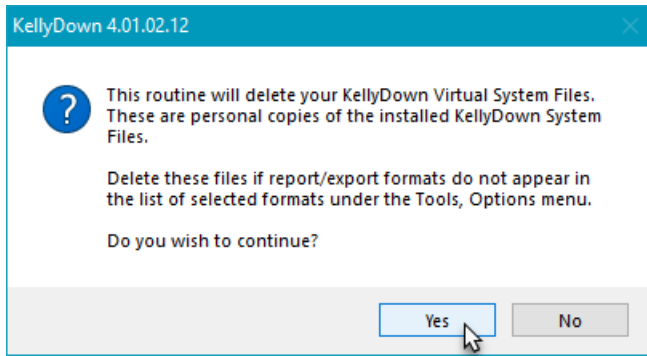

5. Click on the **Run anyway** button. Other warnings may be displayed depending on which anti-virus software is installed on your computer.

6. Continue to install the **KellyDown System Files**.

7. After the KellyDown System Files have been updated, run KellyDown and click on the **Administration, Utilities, Reset KellyDown Virtual System Files** menu.
8. Answer **Yes** to delete the Virtual System Files. This will cause the virtual files to be updated with the newly installed files.

9. The expected new coordinate systems and/or new functionality should now be evident in KellyDown.
